

Assignment 21: Console-Based Apex Email Notification System

Step 1: Open Apex Classes

Go to: **Setup** → **Quick Find** → **Apex Classes** → **New**

Class Name:

Step 2: Write Apex Code (Without Attachment)

Paste this code:

```
public class EmailSender {  
  
    public static void sendEmail(String toEmail,  
                                String subject,  
                                String body) {  
  
        Messaging.SingleEmailMessage mail =  
            new Messaging.SingleEmailMessage();  
  
        mail.setToAddresses(new String[] {toEmail});  
        mail.setSubject(subject);  
        mail.setPlainTextBody(body);  
  
        Messaging.sendEmail(  
            new Messaging.SingleEmailMessage[] {mail}  
        );  
  
        System.debug('Email sent successfully');  
    }  
}
```

Click **Save**.

Step 3: Execute Console Program (Without Attachment)

Go to: **Developer Console** → **Debug** → **Open Execute Anonymous Window**

Paste:

```
EmailSender.sendEmail(  
    'yourmail@gmail.com',  
    'Test Email',  
    'Hello from Salesforce Apex Email Service'  
);
```

Click: **Execute**

Step 4: With Attachment Version

If assignment asks attachment support, replace Apex code with this:

```
public class EmailSender {  
  
    public static void sendEmailWithAttachment(String toEmail,  
                                                String subject,  
                                                String body) {  
  
        Messaging.SingleEmailMessage mail =  
            new Messaging.SingleEmailMessage();  
  
        mail.setToAddresses(new String[] {toEmail});  
        mail.setSubject(subject);  
        mail.setPlainTextBody(body);  
  
        Messaging.EmailFileAttachment attach =  
            new Messaging.EmailFileAttachment();  
  
        attach.setFileName('sample.txt');  
        attach.setBody(Blob.valueOf('This is sample attachment content'));  
  
        mail.setFileAttachments(  
            new Messaging.EmailFileAttachment[] {attach}  
        );  
  
        Messaging.sendEmail(  
            new Messaging.SingleEmailMessage[] {mail}  
        );  
  
        System.debug('Email with attachment sent successfully');  
    }  
}
```

Click **Save**.

Step 5: Execute Console Program (With Attachment)

Go to: **Developer Console** → **Debug** → **Open Execute Anonymous Window**

Paste:

```
EmailSender.sendEmailWithAttachment(  
    'yourmail@gmail.com',  
    'Attachment Email',  
    'Please check attached file'  
);
```

Click: **Execute**

Step 6: Check Output

Go to: **Developer Console** → **Logs**

Check debug message:

```
Email sent successfully
```

or

```
Email with attachment sent successfully
```

Also check recipient inbox.

Viva Points

- `Messaging.SingleEmailMessage` is Salesforce built-in email class.
- `setToAddresses()` sets recipient email.
- `setSubject()` sets email subject.
- `setPlainTextBody()` sets email message.
- `Messaging.sendEmail()` sends email.
- `Messaging.EmailFileAttachment` adds attachment.
- Execute Anonymous acts as console-based execution.
